
Topic : Form**Hands-On Practice 9.1**

You will code a form in this Hands-On Practice. To get started, launch a text editor. Save the file with the name join.html. You will create a web page with a form similar to the example in Figure 9.1.

Figure 9.1 Example form.

1. Modify the title element to display the text: Form Example.
2. Configure an h1 element with the text: Join Our Newsletter.
3. You are ready to configure the form area. A form begins with the form element. Place your cursor on a blank line under the heading you just added and type in a <form> tag as follows:

```
<form method="get">
```

As you read through the chapter, you will find that a number of attributes can be used with the <form> element. In your first form, we are using the minimal HTML needed to create the form.

4. To create the form control for the visitor's e-mail address to be entered, type the following code on a blank line below the form element:

```
E-mail: <input type="text" name="email" id="email"> <br><br>
```

This places the text "E-mail:" in front of the text box used to enter the visitor's e-mail address. The input element has a type attribute with the value of text that causes the browser to display a text box. The name attribute assigns the name email to the information entered into the text box (the value) and could be used by server-side processing. The id attribute uniquely identifies the element on the page. The
 elements configure line breaks.

5. Now you are ready to add the submit button to the form on the next line. Add a value attribute set to “Sign Me Up!”:

```
<input type="submit" value="Sign Me Up!">
```

This causes the browser to display a button with “Sign Me Up!” instead of the default value of Submit Query.

6. Add a blank space after the submit button and code a reset button:

```
<input type="reset">
```

7. Next, code the closing form tag:

```
</form>
```

Save your file. Test your page in a browser. It should look similar to Figure 9.1.

Try to enter some information into your form. Try to click the submit button. Don’t worry if the form redisplay but nothing seems to happen when you click the button—you haven’t configured this form to work with any server-side processing.

Hands-On Practice 9.2

1. In this Hands-On Practice, you will create a contact form with the following form controls: a First Name text box, a Last Name text box, an E-mail text box, and a Comments scrolling text box. You’ll use the form you created in Hands-On Practice 9.1 (see Figure 9.1) as a starting point. Save the file with the name contact.html. The new contact form is shown in Figure 9.2.

Figure 9.2 A typical contact form

1. Modify the title element to display the text: Contact Form.

2. Configure the h1 element with the text: Contact Us.

3. A form control for the e-mail address is already coded. Refer to Figure 9.2 and note that you'll need to add text box form controls for the first name and last name above the e-mail form control. Position your cursor after the opening form tag and press the enter key twice to create two blank lines. Add the following code to accept the name of your web page visitor:

```
First Name: <input type="text" name="fname"
id="fname"><br><br>
```

```
Last Name: <input type="text" name="lname"
id="lname"><br><br>
```

4. Now you are ready to add the scrolling text box form control to the form using a <textarea> tag on a new line below the e-mail form control. The code follows:

```
Comments:<br>
<textarea name="comments" id="comments"></textarea><br>
<br>
```

Save your file and display in a browser to view the default display of a scrolling text box. Note that this default display will differ by browser. Some browsers initially display a vertical scroll bar, while other browsers only render scroll bars after enough text is entered to require them. The developers of browser rendering engines determine the default display of form controls.

5. Let's configure the rows and cols attributes for the scrolling text box form control. Modify the <textarea> tag and set rows="4" and cols="40" as follows:

```
Comments:<br>
<textarea name="comments" id="comments" rows="4"
cols="40"></textarea><br><br>
```

6. Next, modify the text displayed on the submit button (set the value attribute to "Contact"). Save your file. Test your page in a browser. It should look similar to Figure 9.2.

Hands-On Practice 9.3

1. In this Hands-On Practice, you will add the label element to the text box and scrolling text area form controls on the form you created in Hands-On Practice 9.2 (see Figure 9.2) as a starting point. Launch a text editor and open the file located at contact.html . Save the file with the name label.html.

1. Locate the text box for the first name. Add a label element to wrap around the input tag as follows:

```
<label>First Name: <input type="text" name="fname" id="fname"> </label>
```

2. Using the method shown previously, add a label element for the last name and e-mail form controls.

3. Configure the text “Comments:” within a label element. Associate the label with the scrolling text box form control.

Sample code follows:

```
<label for="comments">Comments:</label><br>
<textarea name="comments" id="comments" rows="4"
cols="40"></textarea>
```

4. Save your file. Test your page in a browser. It should look similar to the page shown in Figure 9.2—the label elements do not change the way the page displays, but a web visitor with physical challenges should find the form easier to use.

Question : Can you see the different between hands on practice 9.2 and hands on practice 9.3?

Hands-On Practice 9.4 : Style a form with CSS

Figure 9.3

These are the sample code to style form with CSS.

```

lighthouse.css  starter.html  table1a.html  menu.html  menuCSS3.html  form1.html  formcss.html
File Edit View

<!DOCTYPE html>
<html lang="en">
<head>
<title>Contact Form</title>
<meta charset="utf-8">
<style>
form { background-color:#eaeaea;
      font-family: Arial, sans-serif;
      width: 350px; padding: 10px;}
label { float: left; clear: left;
       display: block; width: 100px;
       text-align: right;
       padding-right: 10px;
       margin-top: 10px; }
input, textarea { margin-top: 10px;
                  display: block;}
#mySubmit { margin-left: 110px; }
</style>
</head>
<body>
<h1>Contact Us</h1>
<form>
  <label for="myName">Name:</label>
  <input type="text" name="myName" id="myName">
  <label for="myEmail">E-mail:</label>
  <input type="text" name="myEmail" id="myEmail">
  <label for="myComments">Comments:</label>
  <textarea name="myComments" id="myComments" rows="2" cols="20"></textarea>
  <input id="mySubmit" type="submit" value="Submit">
</form>
</body>
</html>

```

Hands-On Practice 9.5 : Practice with a HTML5 Form

The screenshot shows a web browser window with multiple tabs. The active tab is titled 'Comment'. The address bar shows a file path: C:/Users/ZenBook%20Flip/OneDrive%20-%20UTHM/Desktop/OneDrive%20-%20UTHM/Documents/2.%20web%20design/O... The page content is a 'Comment Form' with the following elements:

- Form Title:** Comment Form
- Instruction:** Required fields are marked with an asterisk *
- Fields:**
 - * First Name: Text input field with placeholder 'your first name'.
 - * Last Name: Text input field with placeholder 'your last name'.
 - * E-mail: Text input field with placeholder 'you@yourdomain.com'.
 - Rating (1 — 10): A range input field with a blue slider.
 - * Comments: Textarea input field with placeholder 'your comments here'.
- Submit Button:** A button labeled 'Submit'.

Figure 9.4

In this Hands-On Practice, you will configure a form that accepts a first name, a last name, an e-mail address, a rating value, and comments from a website visitor.

1. Modify the title element to display the text: Comment Form.

Configure the text within the h1 element to be: Comment Form. Add a paragraph to indicate: Required fields are marked with an asterisk *.

2. Configure the form element to submit the form information to the textbook's form processor at <https://webdevbasics.net/scripts/demo.php>.

```
<form method="post" action="https://webdevbasics.net/scripts/demo.php">
```

3. Code the form labels and controls. Configure the first name, last name, e-mail, and comment information to be required. Use an asterisk to inform your web page visitor about the required fields. Use type="email" instead of type="input" for the email address. Use the placeholder attribute to provide hints to the user in the name and e-mail form controls. Add a slider control (use type="range") to generate a value from 1 to 10 for the rating. The HTML follows:

```
<form method="post" action="https://webdevbasics.ent/scripts/demo.php">
```

```
<label for="myFirstName">* First Name</label>
```

```
<input type="text" name="myFirstName" id="myFirstName" required="required"
placeholder="your first name">
```

```
<label for="myLastName">* Last Name</label> <input type="text"
name="myLastName" id="myLastName" required="required" placeholder="your last
name">
```

```
<label for="myEmail">* E-mail</label> <input type="email" name="myEmail"
id="myEmail" required="required" placeholder="you@yourdomain.com">
```

```
<label for="myRating">Rating (1 &mdash; 10) </label>
```

```
<input type="range" name="myRating" id="myRating" min="1" max="10">
```

```
<label for="myComments">* Comments</label>
```

```
<textarea name="myComments" id="myComments"
```

```
rows="2" cols="40"
```

```
required="required"
```

```
placeholder="your comments here">
```

```
</textarea>
```

```
<input type="submit" value="Submit">
```

```
</form>
```

4. Code embedded CSS. Configure the label element selector to use block display with a 20px top margin. Configure the input element selector to use block display with a 20 pixel bottom margin. The CSS is as follows :

```
label { display: block;
```

```
margin-top: 20px; }
```

```
input { display: block;
```

```
margin-bottom: 20px; }
```

5. Save your file. Test your page in a browser. If you use a browser that supports the HTML5 features used in the form, your page should look similar to Figure 9.4. The display in other browsers will depend on the level of HTML5 support.

6. Try submitting the form without entering any information.

Figure 9.5

Figure 9.5 shows the error message displayed by browser.
